***Election/Restrictions***

1. Restriction to one of the following inventions is required under 35 U.S.C. 121:

I. Claims 1-6 and 11-14, drawn to an apparatus and a method for measuring the position of an actuator as a function of a frequency of a control signal, classified in Class 361, subclass 182.

II. Claims 7-10, drawn to a method for measuring the position of an actuator driven by a DC driving voltage signal wherein the position signal corresponds to the position of the coil relative to the core as a predetermined function of the phase shift, classified in Class 361, subclass 185.

2. The inventions are distinct, each from the other because of the following reasons:

Inventions I and II are related as subcombinations disclosed as useable in a single combination. The subcombinations are distinct from each other if they are shown to be separately useable. In the instant case, invention I has separate utility such as in an apparatus comprising a permanent magnet core, a coil, an oscillation circuit having an AC signal corresponding to an instantaneous current flowing through the coil and having a measurement output signal that has a frequency corresponding to the position of the coil relative to the core, and a converter converting the frequency of the measurement output signal into a position output signal indicating the corresponding to the position of the coil relative to the core; invention II has separate utility such as in an apparatus for measuring the position of an actuator, which has a coil that moves relative to a core of a magnet, wherein the actuator is driven by applying a DC driving voltage signal to the coil, superimposing a constant-amplitude, sinusoidal voltage signal on the DC driving voltage signal, measuring an alternating current signal through

and an AC voltage signal of the coil, measuring a phase shift between the AC coil signal and the AC voltage signal, and calculating a position signal corresponding to a position of the coil relative to the core as a predetermined function of the phase shift. See (MPEP 806.05(d)).

3. Because these inventions are distinct for the reasons given above and have acquired a separate status in the art as shown by their different classification, restriction for examination purposes as indicated is proper.

4. Applicant is advised that the reply to this requirement to be complete must include an election of the invention to be examined even though the requirement be traversed (37 CFR 1.143).

5. Applicant is reminded that upon the cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 CFR 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the application. Any amendment of inventorship must be accompanied by a request under 37 CFR 1.48(b) and by the fee required under 37 CFR 1.17(i).
